## Bluetooth Serial treo 650

Posted by GuardiÃ£o - 2009/04/30 15:05

---

Hi all! I'm developing an application that connects with a system with the serial over bluetooth(serial port emulator) but I'm having problems with this:

I maked the search of the devices, and I make the connection with the hope device. When I use the function `SrmExtOpen(sysFileCVirtRfComm, &configuracao, sizeof(configuracao), &IdPorta)`, this return `serErrNotSupported`, what I think the is impossible because my device(tre 650) supports bluetooth and serial connection.

I'm looking the sample code `BtClientServer` and in the `readme.txt` is showed that the program is supported in Treo 700p, Treo 755p smartphones.

Then I want to know if the treo 650 supportes the serial port emulator via bluetooth. Can any person help me?

Tools: Codewarrior, treo 650 , win xp.

Hi all! Research in another topics, I saw this link <http://www.webalice.it/rodolfo.turco/developmenteng.html> and studied the program `Denteblu` and

this resolved my problem with the `serErrNotSupported`, but other problems appears: when I try to connect one treo 650 with another treo 650, the

connection isn't established. But, when I connect the treo 650 with another device(HP iPAQ 200 - Windows Mobile) the connection is established,

but I can't to send or receive any data. Can any person help me with the send of bytes in a serial bluetooth?
